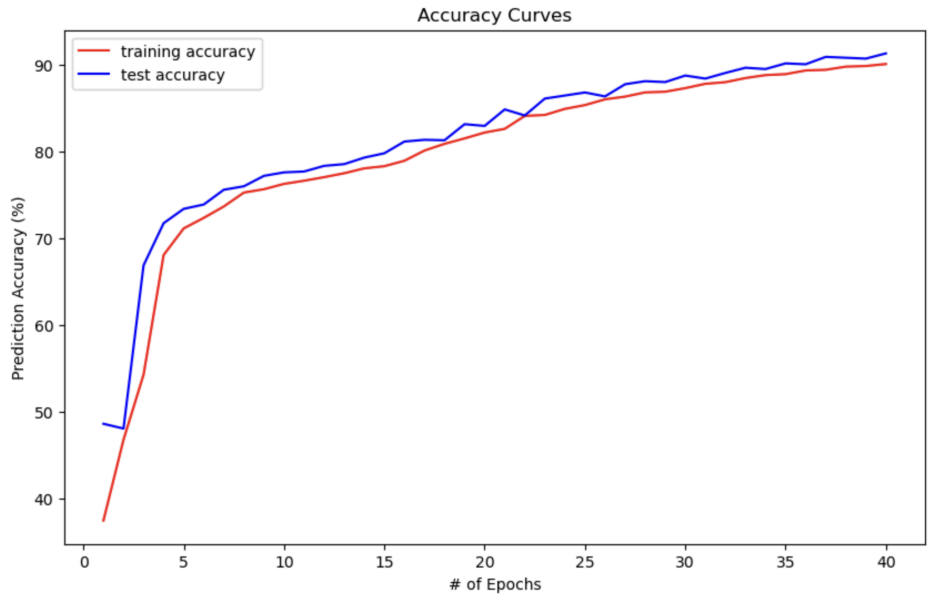
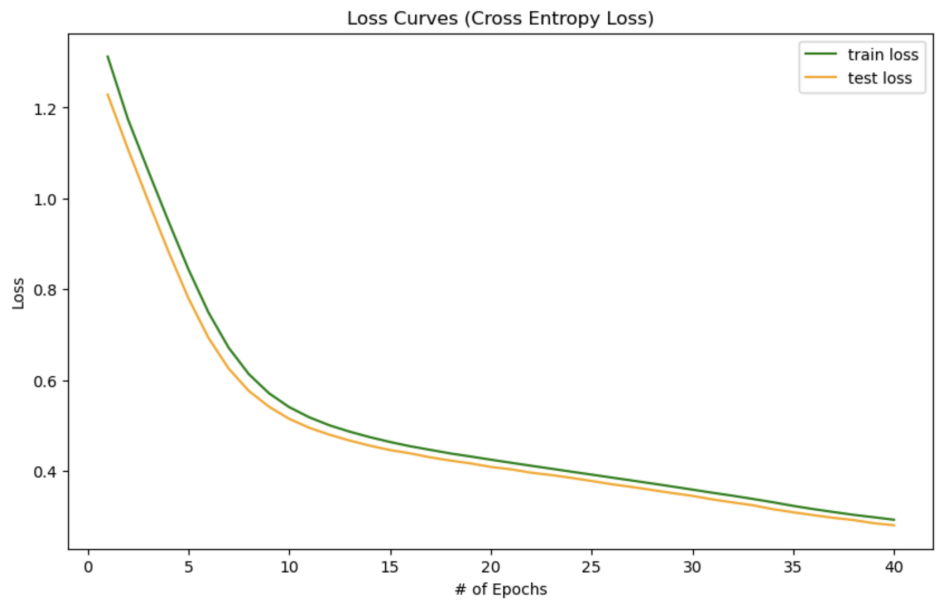
Project 2 Report

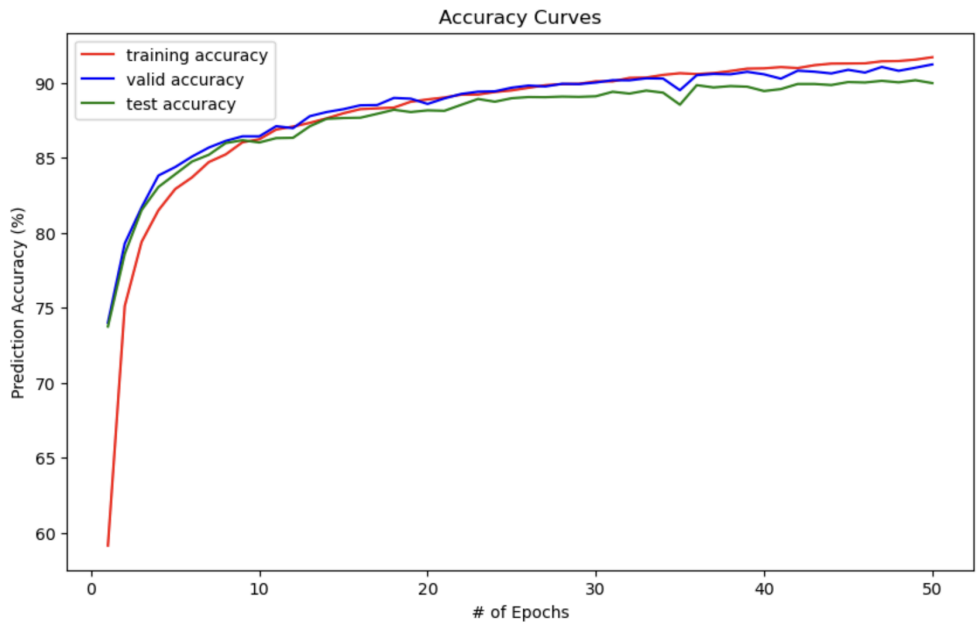
1.

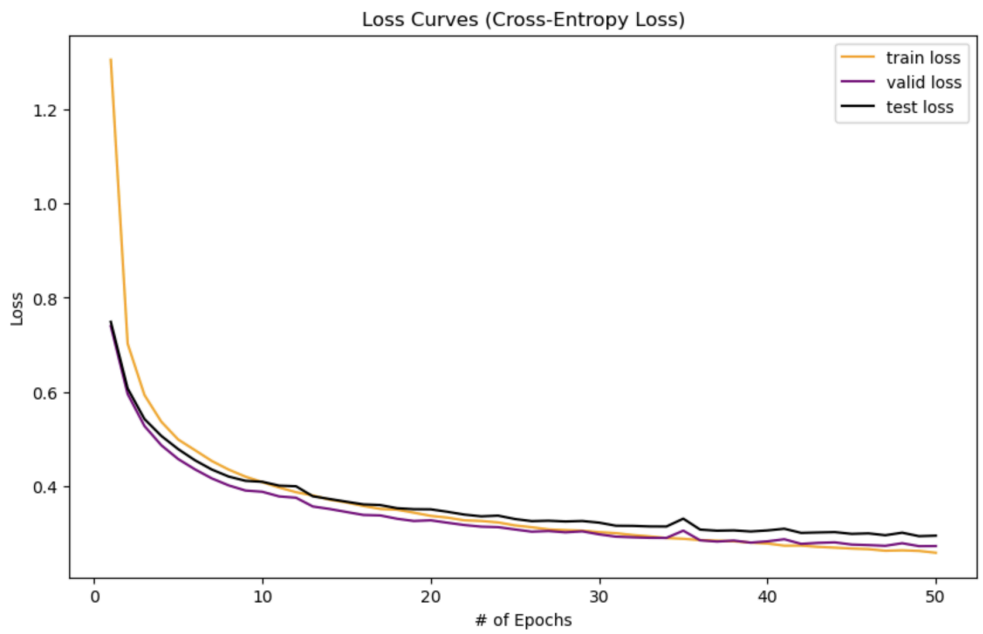




Based on the accuracy and loss curves above, the model appears to be trained reasonably well. Both the training and test accuracies are increasing steadily and reach a training/test accuracy of around 90% after 40 epochs. There is a small gap between the training and test accuracies which points to slight overfitting, but not anything severe. It also appears that the accuracy and loss are still steadily increasing and decreasing respectively, so more epochs may result in improvements to the overall model.

2.





Based on the accuracy and loss curves above, the model appears to show a good convergence with train, validation and test accuracies, thus indicating an overall well-fit model. The train, validation, and test losses also reflect this same conclusion as the curves show a steady decrease with a very small gap between losses, thus suggesting good generalization. When it comes to accuracy, the test accuracy reached a percentage of around 90 after about 45 epochs.
